Outline

Introduction: what is Motion Capture?

History and Motion Capture technologies.

Passive Markers Motion Capture.

Video Based Motion Capture.

Specialized motion capture: face, gaze and hand.

From MoCap to Animation (post-processing)

Motion Capture with passive markers

Goal: reconstruction of the 3D motion of a set of markers

Why passive markers?

No encumbrance on the subject: markers do not require any powering and are hardly sensed by the subjects.

No constraint on the dimension of the working volume is prescribed.

How passive markers work?

Passive markers are constituted of a small plastic support covered with retro-reflecting material (3M™). It marks a certain repera point.

Video-cameras are equipped with a co-axial flash.

Markers appear much brighter than the background making their detection, on the video images, easier.

Constituents of a Motion Capture system with passive markers

- Markers
- Cameras
- Flash (synchronous with frame signal)
- Connections (Fast Ethernet for Motion Analysis)
- Hub
- PC host for processing and display.

Where is marker detection?

PC (Smart™)

Before the Hub (Vicon™, Eagle™, Elite™).

Sequential processing

1. Surveying the image of the moving subject on multiple cameras (*frequency & set-up*).
2. Markers extraction from the background scene (*accuracy & reliability*).
3. Computation of the “real” 2D position of the markers (*accuracy <- distortion*).

Low-level
Vision

4. Matching on multiple cameras.
5. 3D Reconstruction (*accuracy*).

High-level
Vision

An implicit step is CALIBRATION.

Two-levels architecture

Low-level processing

Markers extraction through filtering

Correlation implemented by convolution (template matching or feature extraction)

Implementable
with a DSP

Markers extraction through thresholding

Threshold detection may be not sufficient (high contrast thanks to flashes).
Cluster dimension.
Shape.
Software protection of bright target regions.

High-level processing

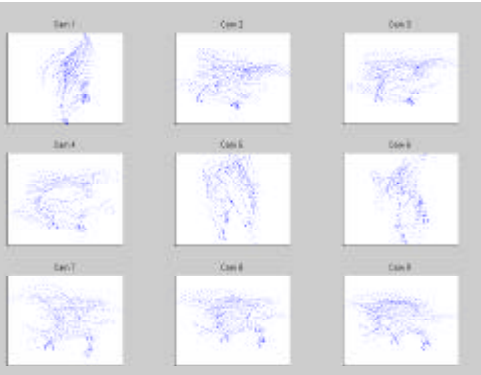

Disadvantages of motion capture systems based on passive markers

When a marker is hidden to the cameras by another body part (e.g. the arm which swings over the hip during gait), the motion capture loses track of it.

The multiple set of 2D data have to be correctly labeled and associated to their corresponding 3D markers.

13/41

The difficulties in data processing

1. Twists and rotations make the movement of the human body fully three-dimensional.
2. Each body part continuously moves in and out of occlusion from the view of the cameras, such that each of them can see only a chunk of the whole trajectory.
3. Some body parts can be hidden to the view by other parts. Whenever it happens, the system should be able to correctly recognize the hidden markers as soon as they reappear without any intervention by the operator.
4. Chunks from the different cameras have to be correctly matched and integrated to obtain a complete motion description.
5. Each trajectory has to be associated with the corresponding body marker (labeling).
6. Reflexes, which do appear in natural environment and are erroneously detected as markers, have to be automatically identified and discarded.

From 2D to 3D

Each camera measures a geometrical transformation (projection)
Triangulation (ray intersection)

Geometrical parameters known.

Main difficulty is correct matching between multiple markers and multiple cameras.

Tracking difficulties

It is a complex problem because:

- Dense set of markers. These may come very close one to the other in certain instants.
- Motion can be easily complex, as it involves rotation and twists of the different body parts (thing at a gymnastic movement).
- Multi-camera information and temporal information is required to achieve a robust tracking.

Tracking processing steps

ACQUISITION OF 2D POINTS

TRACKING:

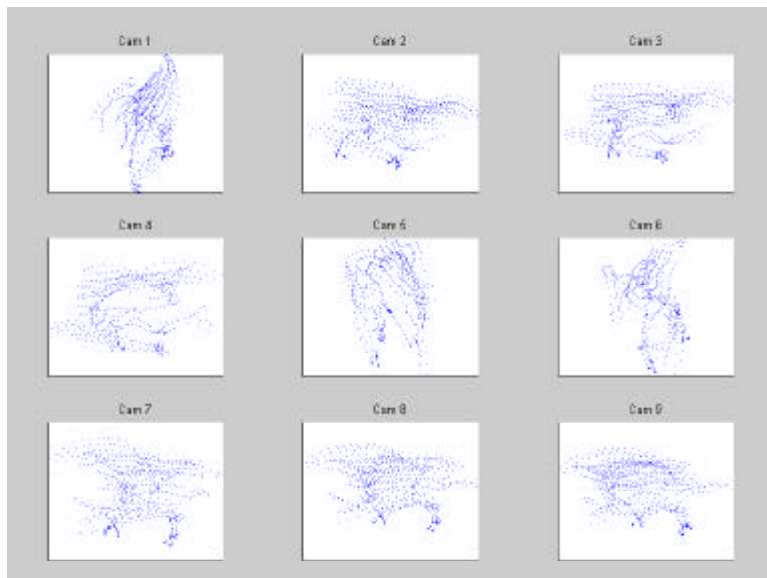

- 1) From 2D points to 2D strings.
- 2) Pairing 2D strings with the epipolar constraint to create 3D strings.
- 3) Condensation of 3D strings.
- 4) Joining 3D strings.

RECTIFY:

- 5) Classification of 3D strings according to the markers arrangement.
- 6) Estimate of the 3D model of the subject from the strings data.
- 7) Estensione automatica della classificazione alle altre stringhe.

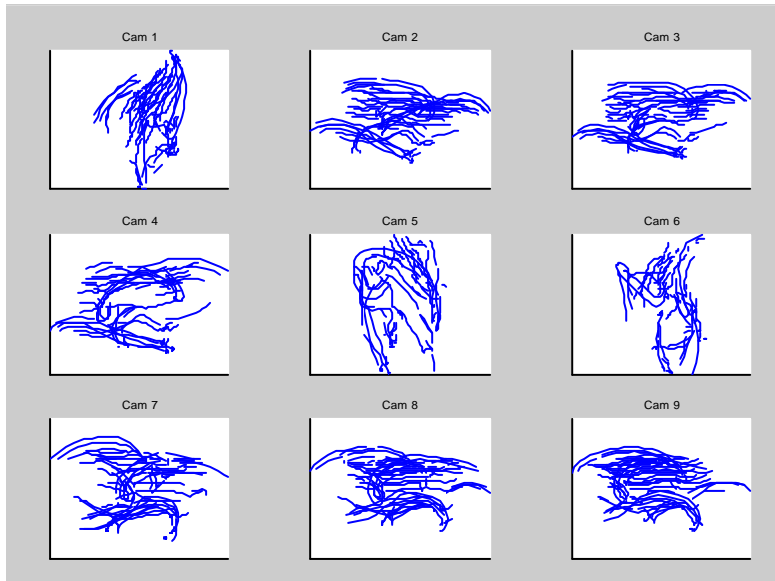

2D tracking

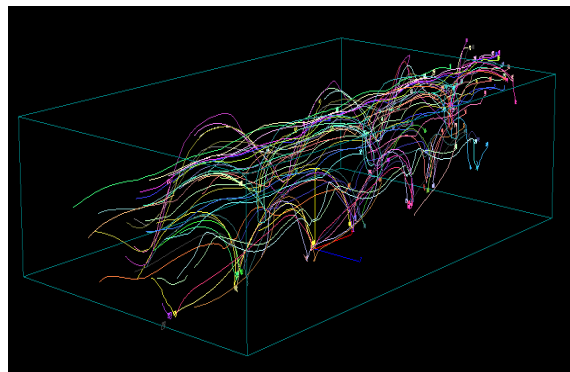

1) Creation of 2D strings

2) Matching 2D strings

Epipolarity constraint

3D strings

3) Condensation of 3D strings

4) Joining 3D strings

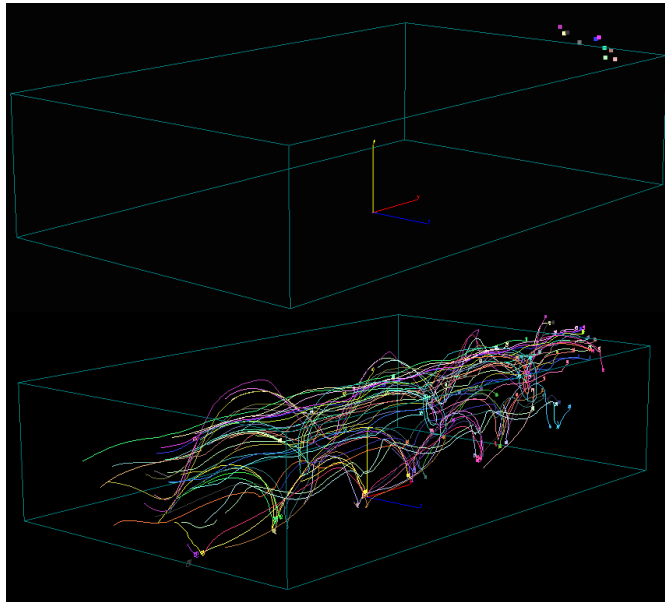

3D strings

3D strings already contain motion 3D information

3D strings

Markers Classification

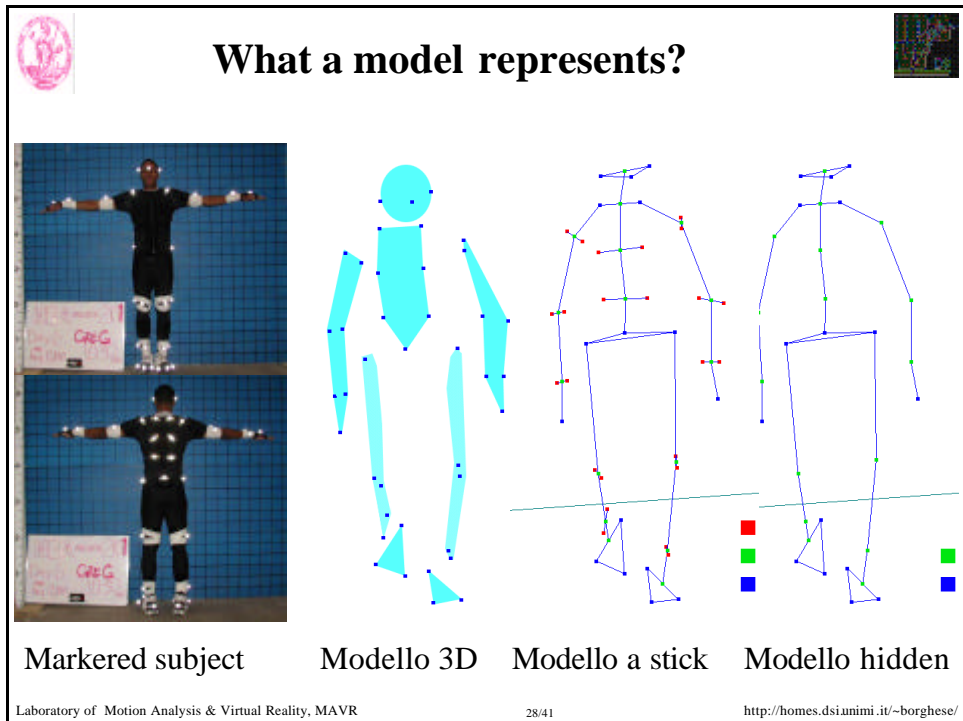

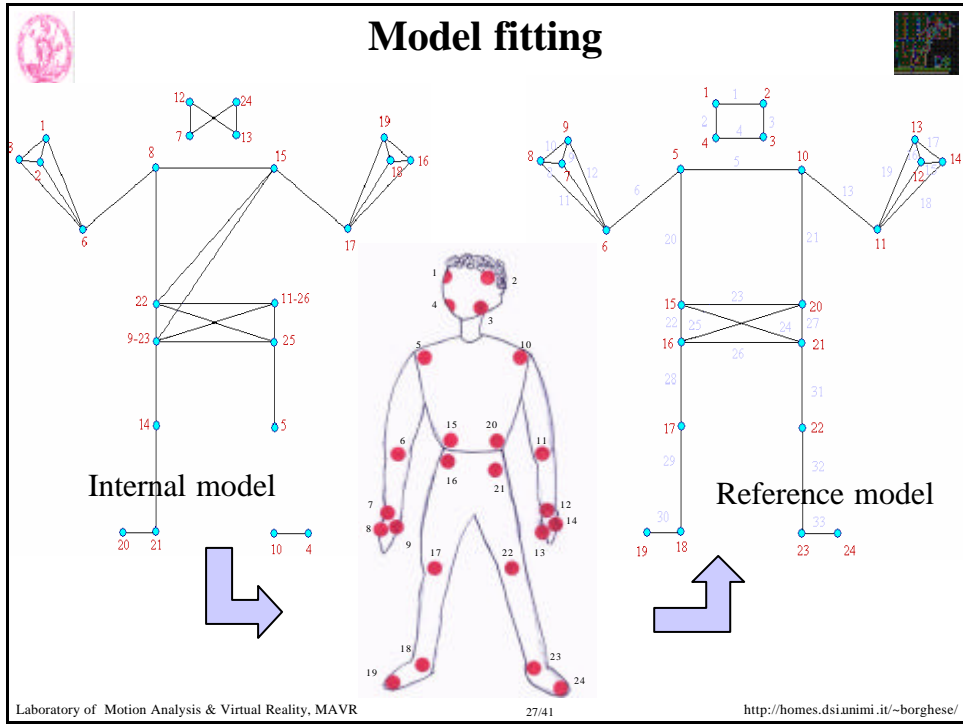

Unregistered HyperCam

5) Initial classification

6) Classification extension

3D strings are automatically extended in this phase.

Two strings are joined on the base of:

- Smooth motion.
- Model checking (a dynamic priority is coded in the number of links).

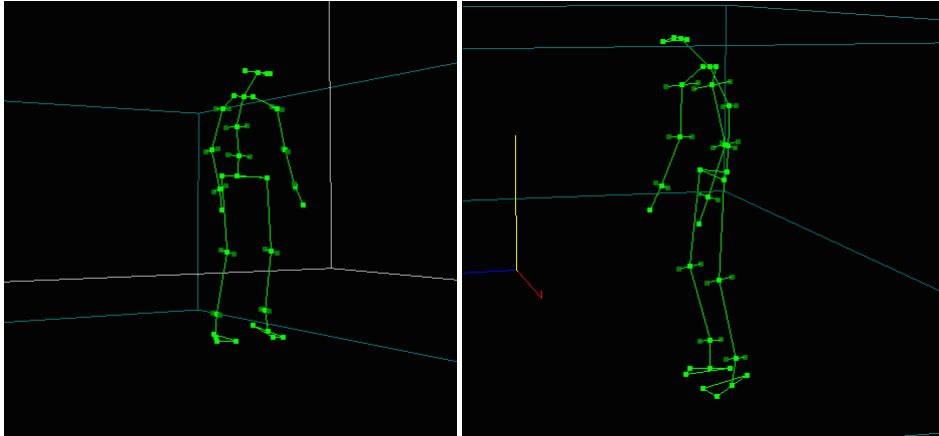

Risultati: run

Risultati: escape

Risultati: head_turn

Risultati: fall_run

Risultati: walk

Risultati: roll

Outline

Introduction: what is Motion Capture?

History and Motion Capture technologies.

Passive Markers Motion Capture.

Video Based Motion Capture.

Specialized motion capture: hand, gaze and face.

From Motion Capture to Animation (post-processing)

Face motion from footage

Reconstructing talking faces from footage (range points -> 3D model -> deformation)
+ Estimate of the camera geometry.

3D model construction through image processing techniques:

- Cross-correlation matching
- Area matching

3D reconstruction through:

- Bundle Adjustment.
- Reinforcement of the matching through multi-view geometry.

Body motion from footage

2 approcci:

- Probabilistico. Stima di un modello parametrizzato e dei parametri di movimento.
- Deterministico. Definisco un modello a-priori e stimo i parametri della camera e del movimento.

A photogrammetric approach

Anthropometry is defined.
Identification of key positions of the model (eventually by image processing)
Calibration and refined interpolation to obtain continuous motion.
Extension of the Bundle-adjustment method to incorporate motion parameters.

<http://www.photogrammetry.ethz.ch>

Computer vision techniques

Silhouette (-> Skeleton)

Set of difficult problems:

2D Image processing (silhouette identification, optical flow detectors...)

Multi-view invariants.

Smooth motion -> temporal filtering.

Skeleton fitting (different rigid motion for different segments).

Pre-prototype research.
