Audio -> Audio rendering

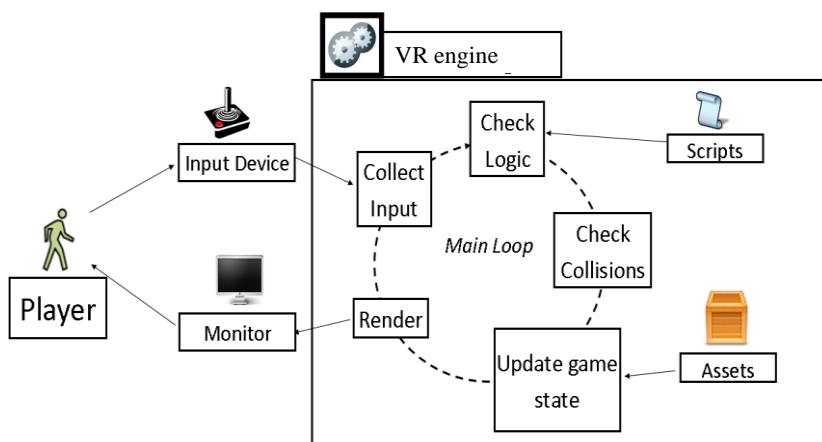

Proprioception -> Vibrators, gloves,...

Olfactory

.....

What is a VR engine?

Graphical representation

Graphical rendering is usually carried out on model represented by triangles => Every shape is transformed into triangles.

- The models created by the scanners are ensembles of triangles (millions of).
- Much more than required by applications.
- RealTime application -> low poly

Mesh compression. Representation of the same geometry/pictorial attributes, with a reduced set of triangles.

VRML format -> X3D

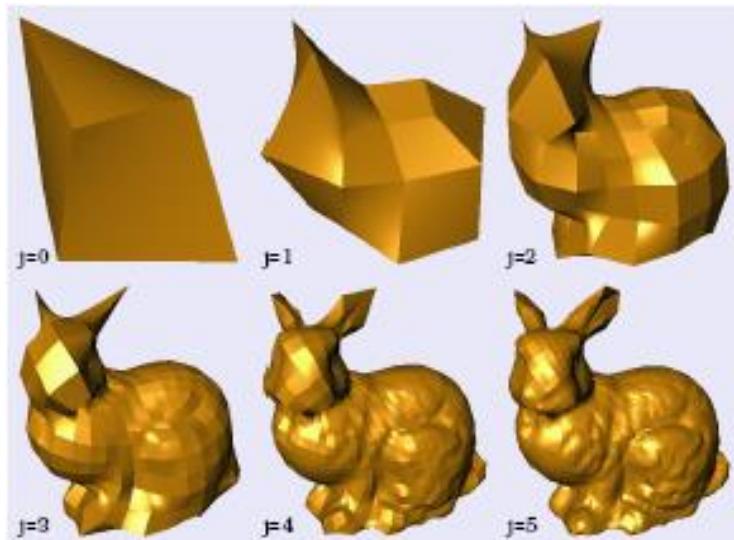

```

Rendering

Precure that "renders", that is generates, an image starting from the Mathematical description of a 3D scene, through algorithms that define the color in each point of the digital image [Wikipedia].

Rendering is based on the physics of the (electromagnetic) waves that describes the interaction between the waves and the interacting mean, causing reflections, refraction, scattering, tunnelling effects...).

We see what is **sent back (reflected)** by the scene => The scene is lit by one or more lights (not light, no image), that is reflected by objects and hits the image plane.

A.A. 2023-2024

8/86

<http://borgese.di.unimi.it/>

The VR engine (visual computing)

Double buffering (for real-time visualization of 3D models) + rasterization.
Quad-buffering from VR.

Interpolation of normals direction among adjacent triangles (to create the appearance of a continuous curved surface)

Graphical pipelining (from 3D geometry to 2D images: projection, colour, texture, shadowing, ...).

Parallelization. GPU programming language (CUDA nVidia).

Hierarchy of structures (objects, collision detection...)

Multiple cache levels.

Look-ahead code optimization (compiler optimization).

Collision detection

Computational demanding ($O(n^2EF)$).

Use of multiresolution models.

Hierarchical detection.

Geometry simplification (axes aligned faces).

Check for common volumes.

Extraction of the faces belonging to these volumes.

Octree of the pairs of candidate faces.

Check for intersection.

2D collision detection

- Collision detection with target can be checked by analyzing the overlapping between part of the motion mask only in particular regions.
- Identification of the motion mask as the outermost part of the body. Approximated collision detection defining general shapes.

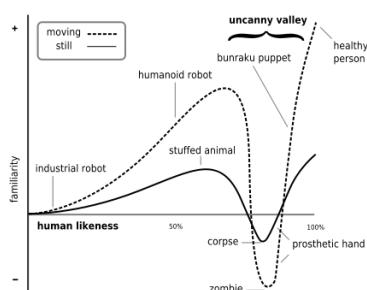

Correct Hand collision area
(most left pixel in the area around first top most high pixel)

- Collision with targets gives hit, collision with distractors gives a miss.
- Same principles implemented with Sony EyeToy Webcam (2003).

Avatar designed avoiding the “uncanny” valley

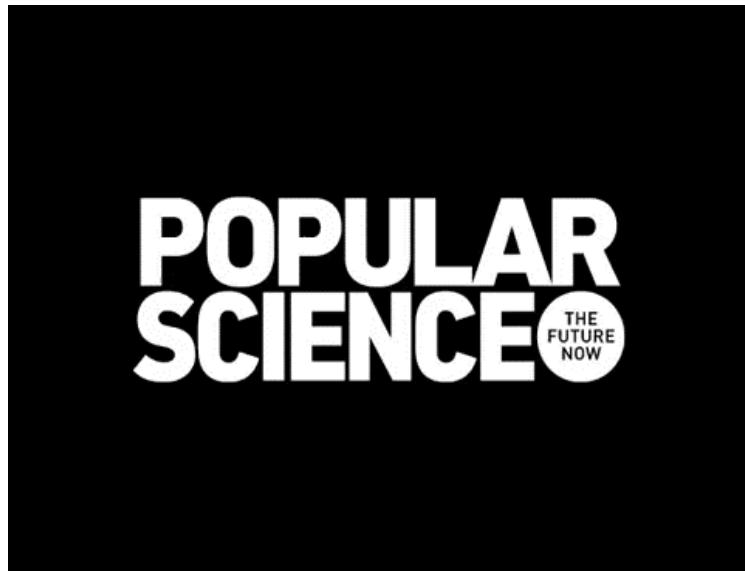

Mori, Masahiro (1970). *Bukimi no tani* The uncanny valley (K. F. MacDorman & T. Minato, Trans.). *Energy*, 7(4), 33–35. (Originally in Japanese)

Uncanny Valley

Lara Croft go puzzle adventure

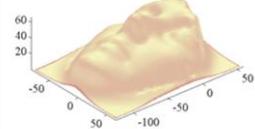

Rush game

3D Scanner: Autoscan - 1997

- Manual scanning through a laser pointer,
- Real-time display feed-back to guide scanning.
- Flexible set-up and portability
- Acquisition of laser spot in real-time at 100 Hz. (max 100 points / sec)
3D reconstruction of the spot through triangulation poses problems due to noise on the measurement of position on the cameras.

3D structure from range data (III)

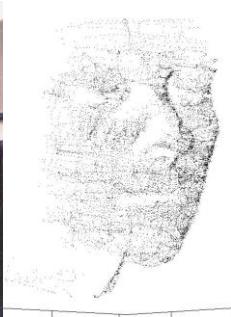

Polhemus hand held laser scanner

A.A. 2023-2024 24/86 <http://borgheze.di.unimi.it/>

From Clouds to surfaces

Effect of measurement noise is clear with Delaunay triangulation.

Need of filtering is evident.

3D structure from points

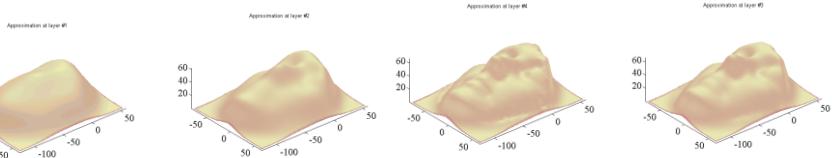

Linear approximation (mesh):

- Delaunay triangulation (Watson, 1981; Fang and Piegl, 1992). Direct tessellation (no filtering).
- Alpha shapes, Ball Pivoting (Bernardini et al., 2000), Power Crust (median axis transform, Amenta, 2002). Post processing to regularize a Delaunay tessellation.

Surface fitting to range data

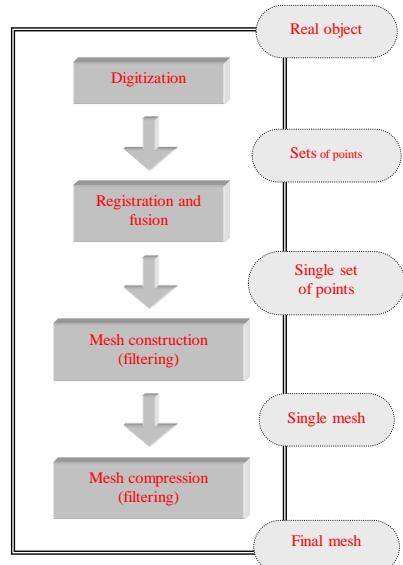

- Snakes (Kass et al., 1988). Energy based approach. Best curves.
- Kohonen maps (1990).
- Radial Basis Functions Networks (Poggio and Girosi, 1995; Ferrari et al. 2005, semi-parametric models, incremental approach).
- Support Vector Regression (SVR, A.Smola and B.Scholkopf)

.....

Scanner 3D modern pipeline

Kinect fusion

Low cost 3D modeling

KinectFusion: Real-time 3D Reconstruction and Interaction

A.A. 2023-2024 Using a Moving Depth Camera, Izadi et al., Proc. Siggraph 2011 <http://borgesse.di.unimi.it/>

3D modelling

Solid modeling

- 3D geometric solids: cubes, cylinders, cones...
- Revolution surfaces.
- Spline and NURBS (Piegle, 1993). CAD, high interactivity.
- Subdivision surfaces (Schroeder, 1999).
- Hierarchy of objects with heritage.

Rendering

- Colour and Texture
- lights => shadows.

Animation

- Motion (animation)
- Camera tracking (for augmented reality), transparencies....

Specialized systems: Finite element models

- It is a class per sé. Local modeling. Mechanical modeling.
- Largely used for animation in medicine (facial animation, deformation of tissue during surgery). Multi-layer modeling.
- Specialized SW are usually associated: Katia, AutoCAD...
- 3D Structure.

Specific CAD for mechanics: Katia, AutoCAD, Nastran SW => **Visual Computing**

Procedural Modelling

Models generated through a procedure (a software program, an algorithm)

It is possible to construct a 3D mesh specifying parametric rules to create the objects.

Examples: Trees, Cities, Mugs,

Artificial plants

A synthetic model of the topiary garden at Levens Hall, England, by
R. Mäch, P. Prusinkiewicz, and M. James. "Garden of L" (inset) by P. Prusinkiewicz,

F. Fracchia, J. Hanan, and D. Fowler;

Haptic displays

Convey to the subject the sensorial information generated in the interaction with the virtual objects: force, material texture...

Measure the force exerted by the subject on the virtual environment.

Haptic displays provide a mechanical interface for Virtual Reality applications.

Most important developments have been made in the robotics field.

International Haptic society - <http://www.isfh.org/>

Sistemi di Output::visione

A.A. 2023-2024

50/86

<http://borgheze.di.unimi.it/>

Optical Output systems

Requirements for the monitor:

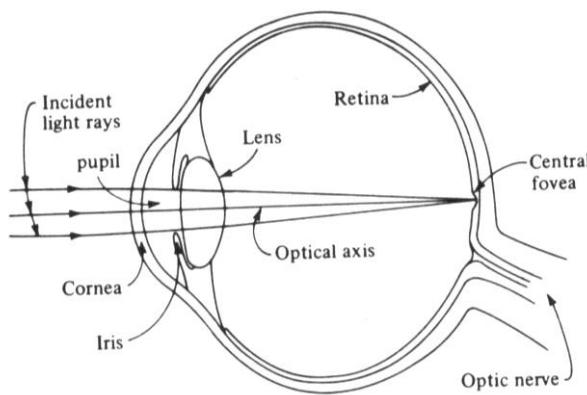

- Large field of view ($180^\circ \times 150^\circ$).
- High spatial resolution (35 pixels/degree, equivalent to 12,000x12,000 pixels for a 19" display positioned at 70cm from the viewer).

Requirements for the world generator:

- Stereoscopic vision for objects with $D < 10m$.
- Monocular cues for objects with $D > 10m$.
 - - Occlusions.
 - - Geometrical perspective and a-priori model knowledge.
 - - Shading.
 - - Motion.

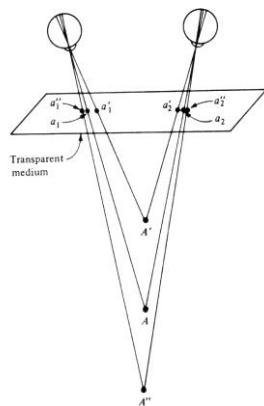

Human eye

Its behavior is very similar to that of a camera
Lens focuses the image, vergence movement orients the eye.

Vergence (stereo-disparity)

Points further away are projected on points closer to the image center.

The sum of these distances is called stereo-disparity and depends on distance.

Stereo-images should have this disparity.

Vergence and focusing are strictly connected.

Also monocular cues: shading, apparent size,

VR sickness

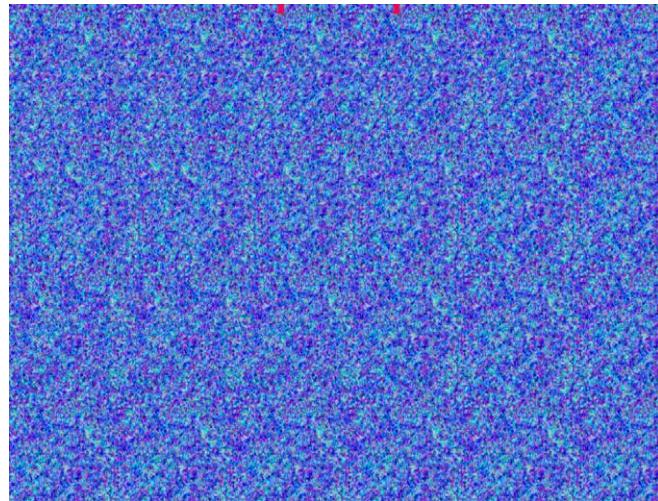

La dissonanza tra la percezione di movimento tra vari organi del nostro corpo, i quali mandano segnali contrastanti al nostro cervello che di conseguenza «va in confusione» e entra in modalità di protezione.

Conflitti sensoriali:

- Vergenza e messa a fuoco
- Movimento apparente dato dalla vista e assenza di movimento reale, determinato dall'apparato vestibolare e somatosensoriale.
 - **L'apparato vestibolare**, che tramite gli organi del Golgi determina l'accelerazione angolare (rotazione) della nostra testa nello spazio.
 - **La vista**, che elabora il movimento degli oggetti esterni rispetto al nostro corpo.
 - **L'apparato somatosensoriale** che tramite muscoli, pelle, tendini e articolazioni riceve informazioni sul movimento del corpo nello spazio.

Autostereogram

To see the 3D image, you need to relax and to try to view "through" the image (focusing at infinity – rettile preistorico volante)

Passive stereo
